Dear Hiring Manager,

Before I wrote a line of Python, I spent nearly four years working out whether people could afford the loans they were asking for.

At Paisabuddy Finance and then Star Housing Finance, I built the financial models behind more than 150 corporate, SME and retail accounts — collateral valuations, loan-to-value ratios, repayment capacity — and wrote the credit memos that approval committees used to say yes or no. Real money, real deadlines, and auditors who cared whether my documentation held up. It was not a glamorous place to start, but it is the reason I read the business before I open the file.

The analytics came out of frustration. I was losing nine hours a week rebuilding the same revenue and territory reports by hand, so I built the Tableau and Excel systems that replaced them. Reporting stopped being a weekly grind and became something leadership could pull for themselves. That is when I worked out what I actually wanted to do: not produce reports, but remove the reason anyone has to ask for one.

That is what brought me to Northeastern for an MS in Business Analytics. The range of problems has widened since. As a graduate assistant I manage the Disability Resource Center's exam-accommodation database, and working through a semester of scheduling data I found the system recorded the time an exam was booked for but never how long students actually used it — so rooms that read as fully booked were sitting half empty. At Jaris Technologies I sized a market with no incumbent in it: I mapped the thirteen steps of an A320 ground turnaround at Toulouse, modelled the cost, time and CO₂ of each, and put a figure on what one serious ramp incident cascades into. About €740,000. Across a ten-aircraft fleet, roughly €2.9 million of annual exposure. That number is now the baseline the product is being built against.

Lending, university operations, aviation. The throughline is the same — finding what the data is quietly saying that nobody has thought to ask about yet.

I work in Python, SQL, R, Tableau, Power BI, and more Excel than I would like to admit. I would rather show you than list it. My portfolio has eleven dashboards I built end to end, most of them interactive, where you can move the assumptions and watch the conclusion change.

If you are hiring someone to make the analysis matter rather than just deliver it, I would like to talk.
